

HOW TO PROTECT YOUR POOL IN FREEZING WEATHER

HELPFUL TIPS AND TRICKS!

1) KEEP YOUR WATER MOVING

- It's important to set your pumps to run continuously. If you have a variable-speed pump, run it at higher speeds.
- Open all lines to ensure proper water flow. If a valve is shut off, no water will flow through the pipe, increasing the chance of damage.

2) PROTECT YOUR EQUIPMENT

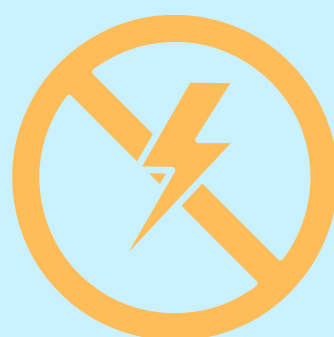

In freezing temperatures, insulate plumbing lines with blankets or towels to prevent freezing.

3) POWER OUTAGE

In the event of extreme weather causing a power outage, please follow these steps:

- Open the air relief valve on your pool's filter.
- Remove the drain plugs from the front and rear headers of your pool heater. If you have a heat pump, remove those drain plugs too.
- Remove the lid and drain plugs from your pump.
- Remove the drain plugs from the filter or any other unit, such as a leaf trap, that holds water, including in-floor system water valves.
- If there is an auto leveler, wrap a towel around the vac break (back-flow preventer) to prevent damage.

Safety is our top priority! As long as roads are drivable, our team will complete service as usual and can assist should any issues pop up. We may have to adjust service days, but we will get everyone caught up and taken care of as soon as possible.
